**Table 1.** Summary information about population count data and administrative unit datasets used to produce the WorldPop datasets for Latin America and the Caribbean. For each country, the Average Spatial Resolution was calculated as the square root of its surface area divided by the number of administrative units and represents the effective resolution of the latter (i.e., the cell size of administrative units if all units were square of equal size)<sup>5</sup>. Superscripts “C”, “E”, and “P”, in the 2<sup>nd</sup>

column, indicate whether the population counts were obtained from either official census, estimates, or projections, respectively. Superscript "G", in the 8<sup>th</sup> column, indicates that the population counts were downloaded from [www.geohive.com](http://www.geohive.com)
